Prof. Shen

CPS 352

2/13/25

Additional Headers:

- Headers from the OpenCV library, installed as shown during class
- `<cmath>`, `<vector>`, and `<iostream>`: all of these should be available if standard C++ is installed

Configuration:

When the project boots, it will ask you for the name of an image to load. This image must be in the same directory as the VS solution (if you want to avoid having to use the absolute path). Make sure to include the file extension. Most of the time it will be .jpg, but check via the terminal or file explorer to be sure.

Once the image boots up, all of the behavior is implemented as described in the instructions. Click and drag to blur out regions; single-click to reset, or press r/R; press i/I to increase blur degree and d/D to decrease.

Pressing s/S will save the image but will NOT exit the program. You can save multiple times in one run. To exit the program, press x/X or Esc.

Image Results:
